# INTRODUCTION AND MOTIVATION

# THE CONTEXT

Pressures to improve resource- and energy-efficiency in industry

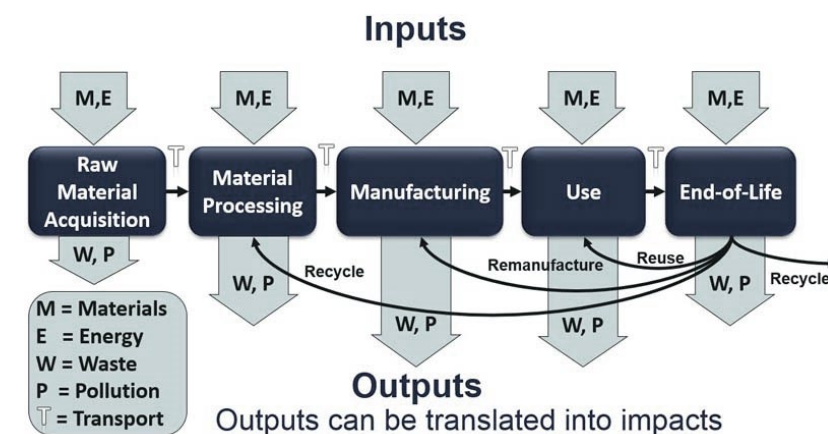

Life Cycle Assessment (LCA) is one of the main methodologies to monitor potential environmental impacts.

State-of-the-art: static yearly analyses based on the requirements of a single environmental label

Not possible to capture any temporal dynamics of industrial processes and cannot flexibly deal with developments in LCA models

## *Temporal dynamics*

Opportunities are offered by automated LCA tools connected to factory data management systems

Reduce data collection costs and time requirements

Possibility to perform automated LCAs at high temporal resolution

?

- How to flexibly deal with:
- differences and developments in LCA models?
  - High amount of LCA results?

### **OUR SOLUTION:** Modular LCA tools

- Integration of modules with different functions;
- Every module can be independently modified while leaving the entire architecture unchanged

# METHODOLOGY PRESENTATION

# DATA COLLECTION – YEARLY LEVEL

Data collection and elaboration at yearly level

Product certification

	A	B	C	D
1	Selected product	Billetta		
2	Product list	Billetta		
3	Billetta	Rotoli laminati	Impact category	
4	Rotoli laminati	Barre laminate		
5	Barre laminate	Rotoli ricotti, Heurtey	Global warming potential (GWP)	Fossil
		Rotoli ricotti, Ebner		Biogenic
		Rotoli ricotti, Continuo		Land use and land transformation
		Barre ricotte		
		Barre bonificate 1		
6	Rotoli ricotti, Heurtey			TOTAL
7	Rotoli ricotti, Ebner			
8	Rotoli ricotti, Continuo			
9	Barre ricotte			
10	Barre bonificate 1			
11	Barre bonificate 2			
12	Update LCAs			
13

16				

# RESTRUCTURING THE DATA COLLECTION

Data collection at monthly level

Time: 12 months →

155 different  
data types  
(consumptions  
and emissions)

Process	Jan	Feb	Mar	Apr	May	Jun
Production						
Production						
Coal DRI						
Gas DRI						
DRI Briquetting						
Scraps						
Fe Si						
Al						
Recycled Al						
Fe Mn 74.5%						
Fe Mn 82.5%						
Fe Si Mn						
Fe Bo						
Fe Cr 55%						
Fe Cr 68%						
Ni						
Fe Mo						
Fe V						

# MODULAR ARCHITECTURE

Compliance to  
environmental labels

Modular LCA  
architecture

LCA Software

Spreadsheet

Coding

Library / BI module

Definition of inventory data to be collected from factory management systems – *foreground* system of the LCA (e.g. costs and production schedules are meaningless for LCA)  
Identification of the available temporal resolution of every data: iterative process

# MODULAR ARCHITECTURE

Compliance to  
environmental labels

Modular LCA  
architecture

LCA Software

Spreadsheet

Coding

Library / BI module

Definition of foreground system of  
the LCA

Development of models for the  
*background* system of the LCA:  
calculation of unitary impacts of  
every consumptions/emissions  
(e.g. electricity, materials, etc..)

# MODULAR ARCHITECTURE

Compliance to  
environmental labels

Modular LCA  
architecture

LCA Software

Spreadsheet

Coding

Library / BI module

Definition of foreground system of  
the LCA

Background system models

- *Collection* of data from multiple sources (LCA software, factory..),
- *Mapping*: link every data with an identifier, a classification, etc..
- *Wrangling*: process the data, using multiple rules, to a format which is easily manageable for the subsequent modules

# MODULAR ARCHITECTURE

Compliance to  
environmental labels

Modular LCA  
architecture

LCA Software

Spreadsheet

Coding

Library / BI module

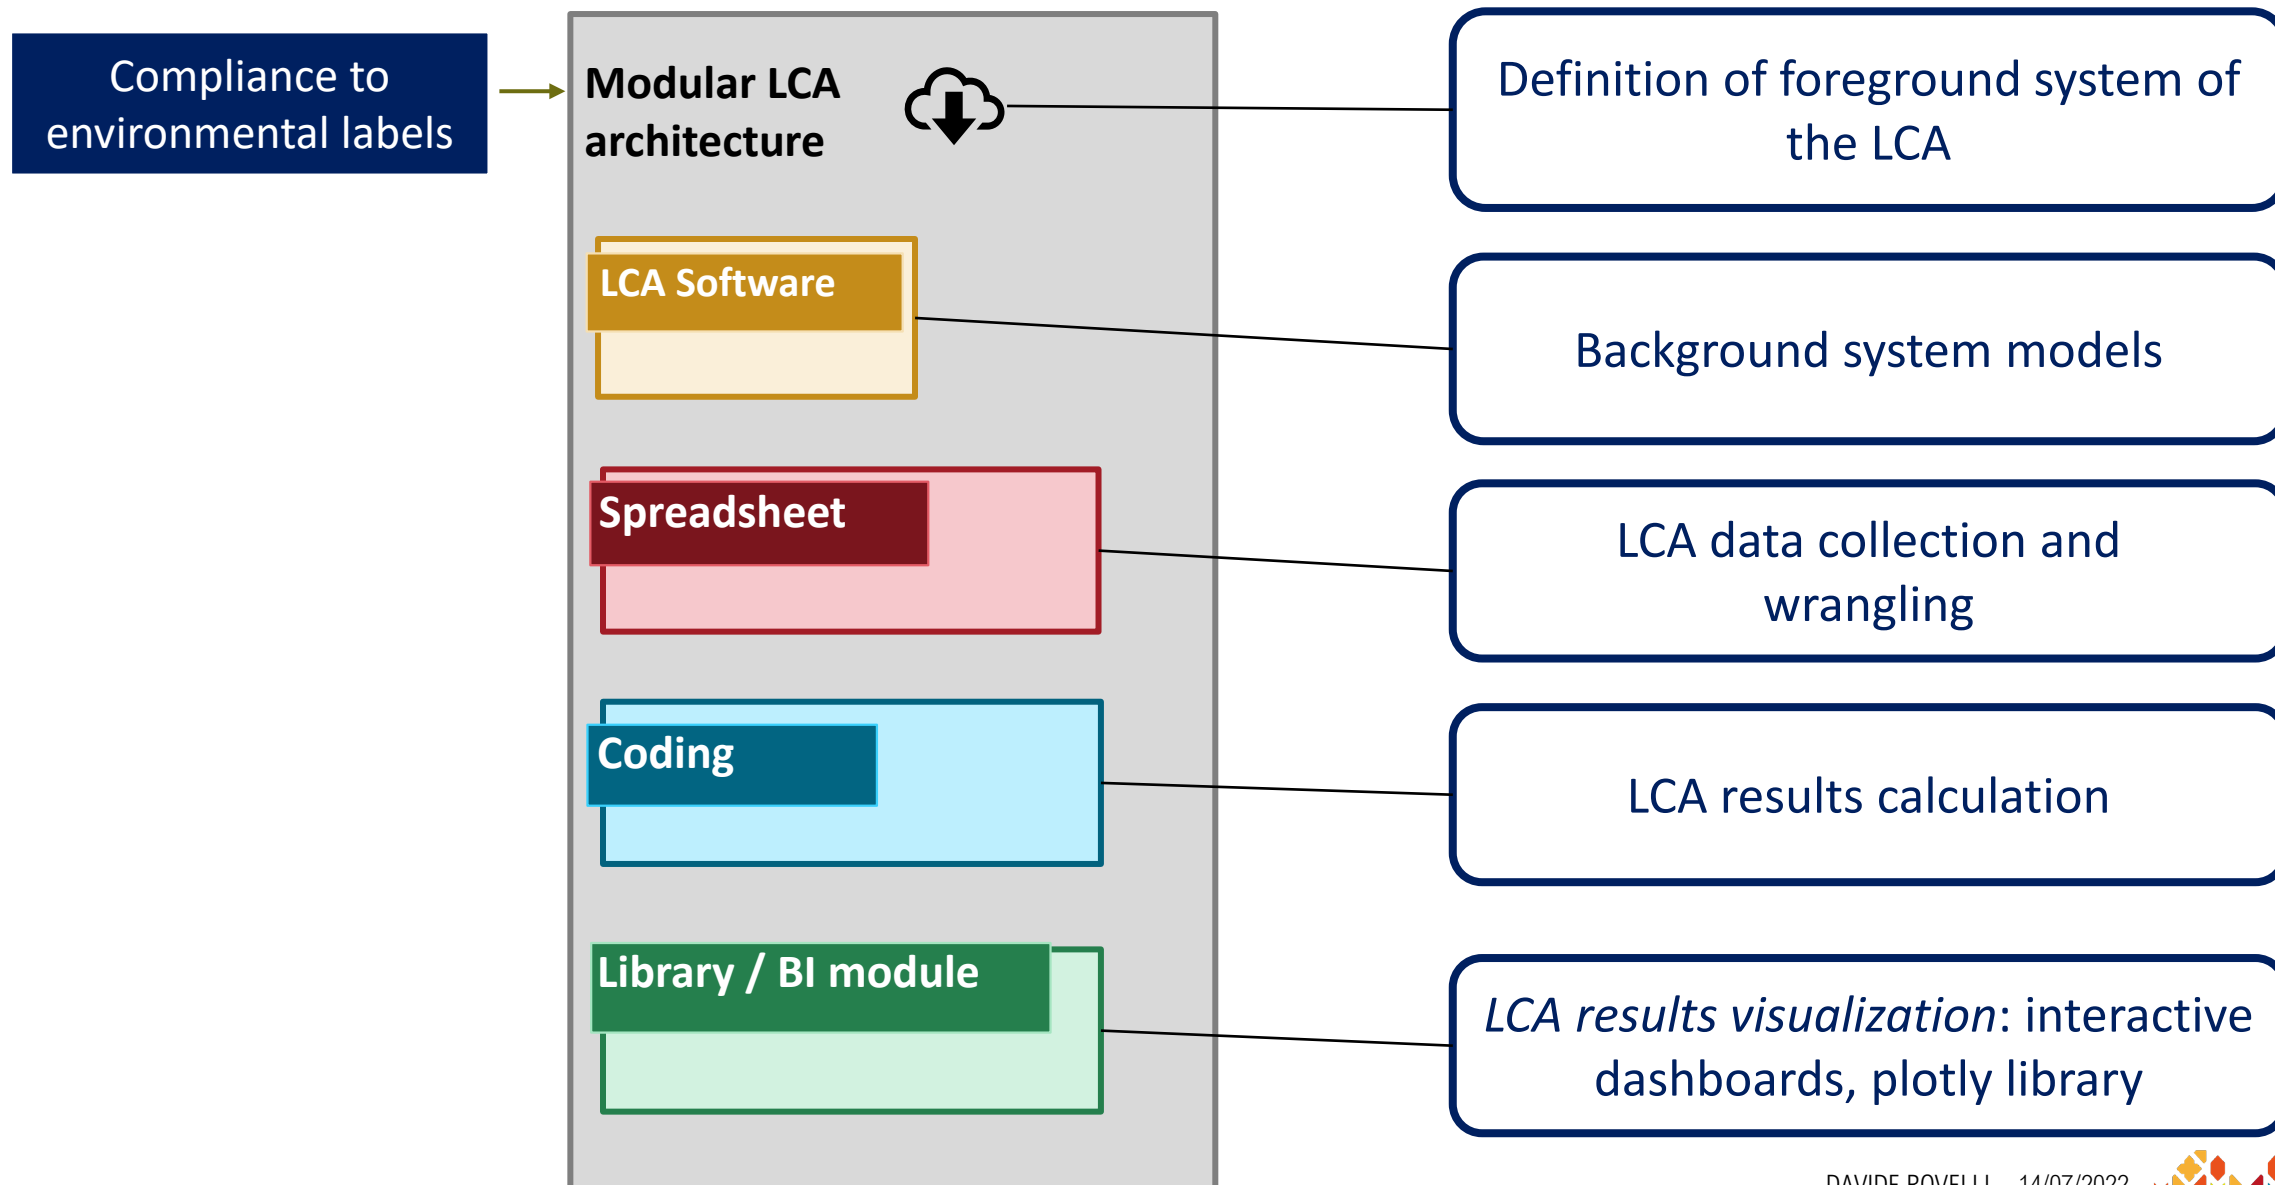

Definition of foreground system of  
the LCA

Background system models

LCA data collection, mapping and  
wrangling

*LCA results calculation:*  
155 consumptions/emissions data,  
9 products,  
37 indicators from EPD and ILCD schemes,  
12 months in a year:  
→  $5 \cdot 10^5$  values of LCA results, processed  
in python

# MODULAR ARCHITECTURE

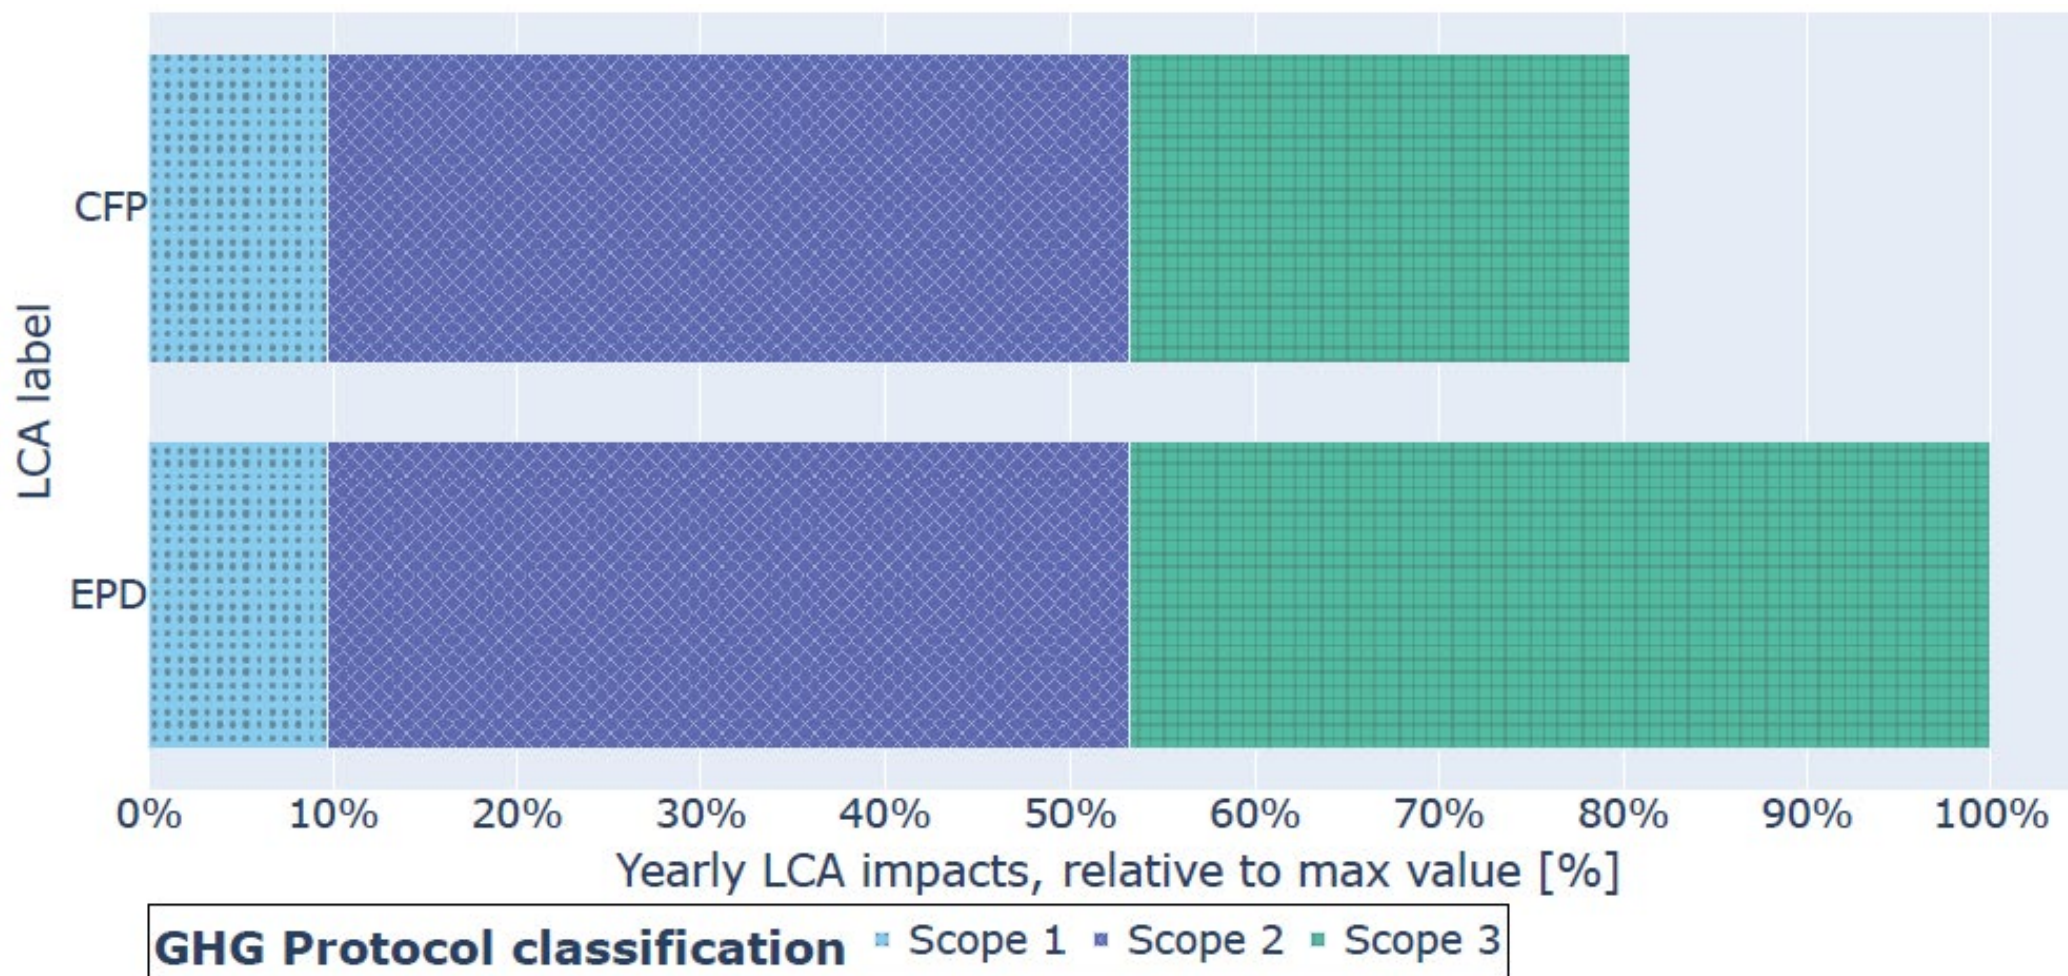

# RESULTS AND DISCUSSION

# VARIABILITY ACROSS LCA LABELS

CFP=Carbon Footprint

EPD=Environmental Product Declaration

# VARIABILITY OF MONTHLY LCA RESULTS – EPD SCHEME

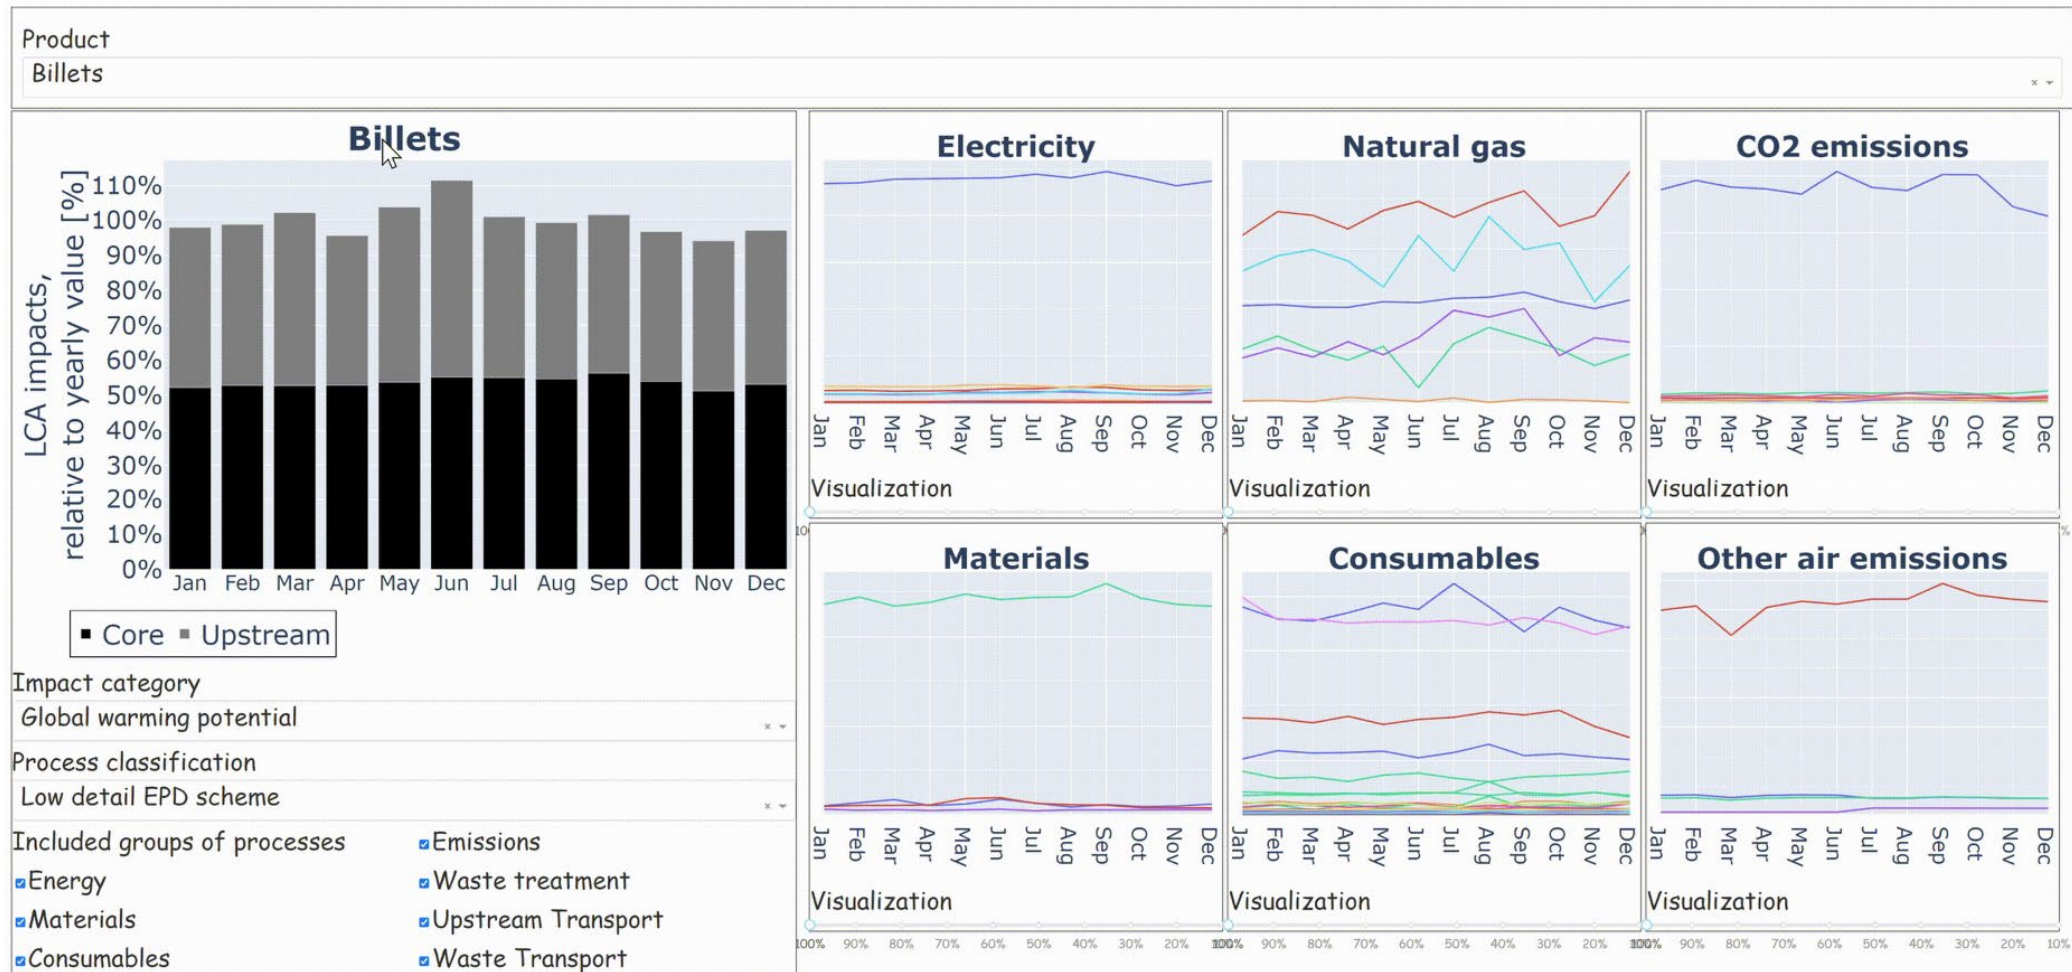

**Impact category, Product**

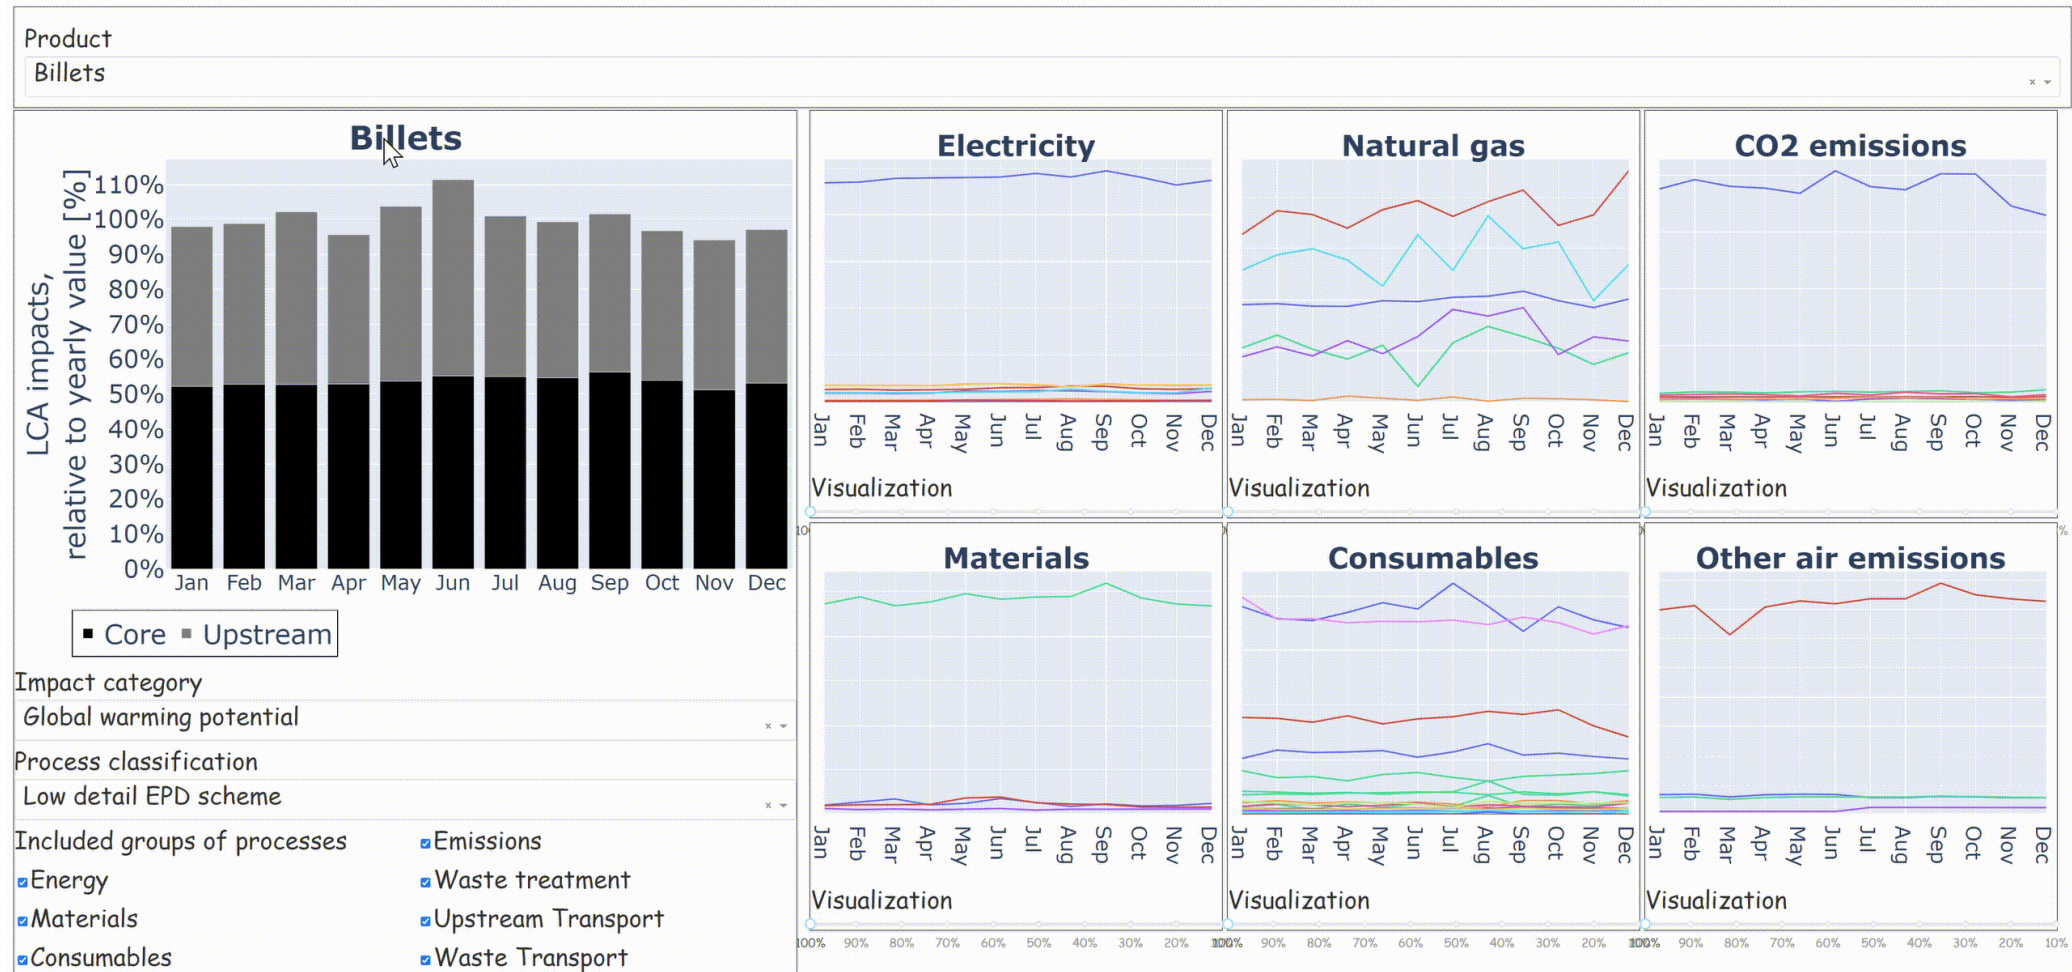

- Global warming potential, Billets
- Global warming potential, Quenched and tempered bars

# WHAT-IF SCENARIOS THROUGH DASHBOARDS

Product  
Quenched and tempered bars, 1

Scenario 1 settings

% heat provided by hydrogen

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

% electricity provided by RES

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Thermal energy demand reduction %

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Electric energy demand reduction %

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Scenario 2 settings

% heat provided by hydrogen

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

% electricity provided by RES

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Thermal energy demand reduction %

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Electric energy demand reduction %

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Environmental impact reduction targets

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Impact category 1

Global warming potential

Impact category 2

Abiotic depletion potential - Elements

# WHAT-IF SCENARIOS THROUGH DASHBOARDS

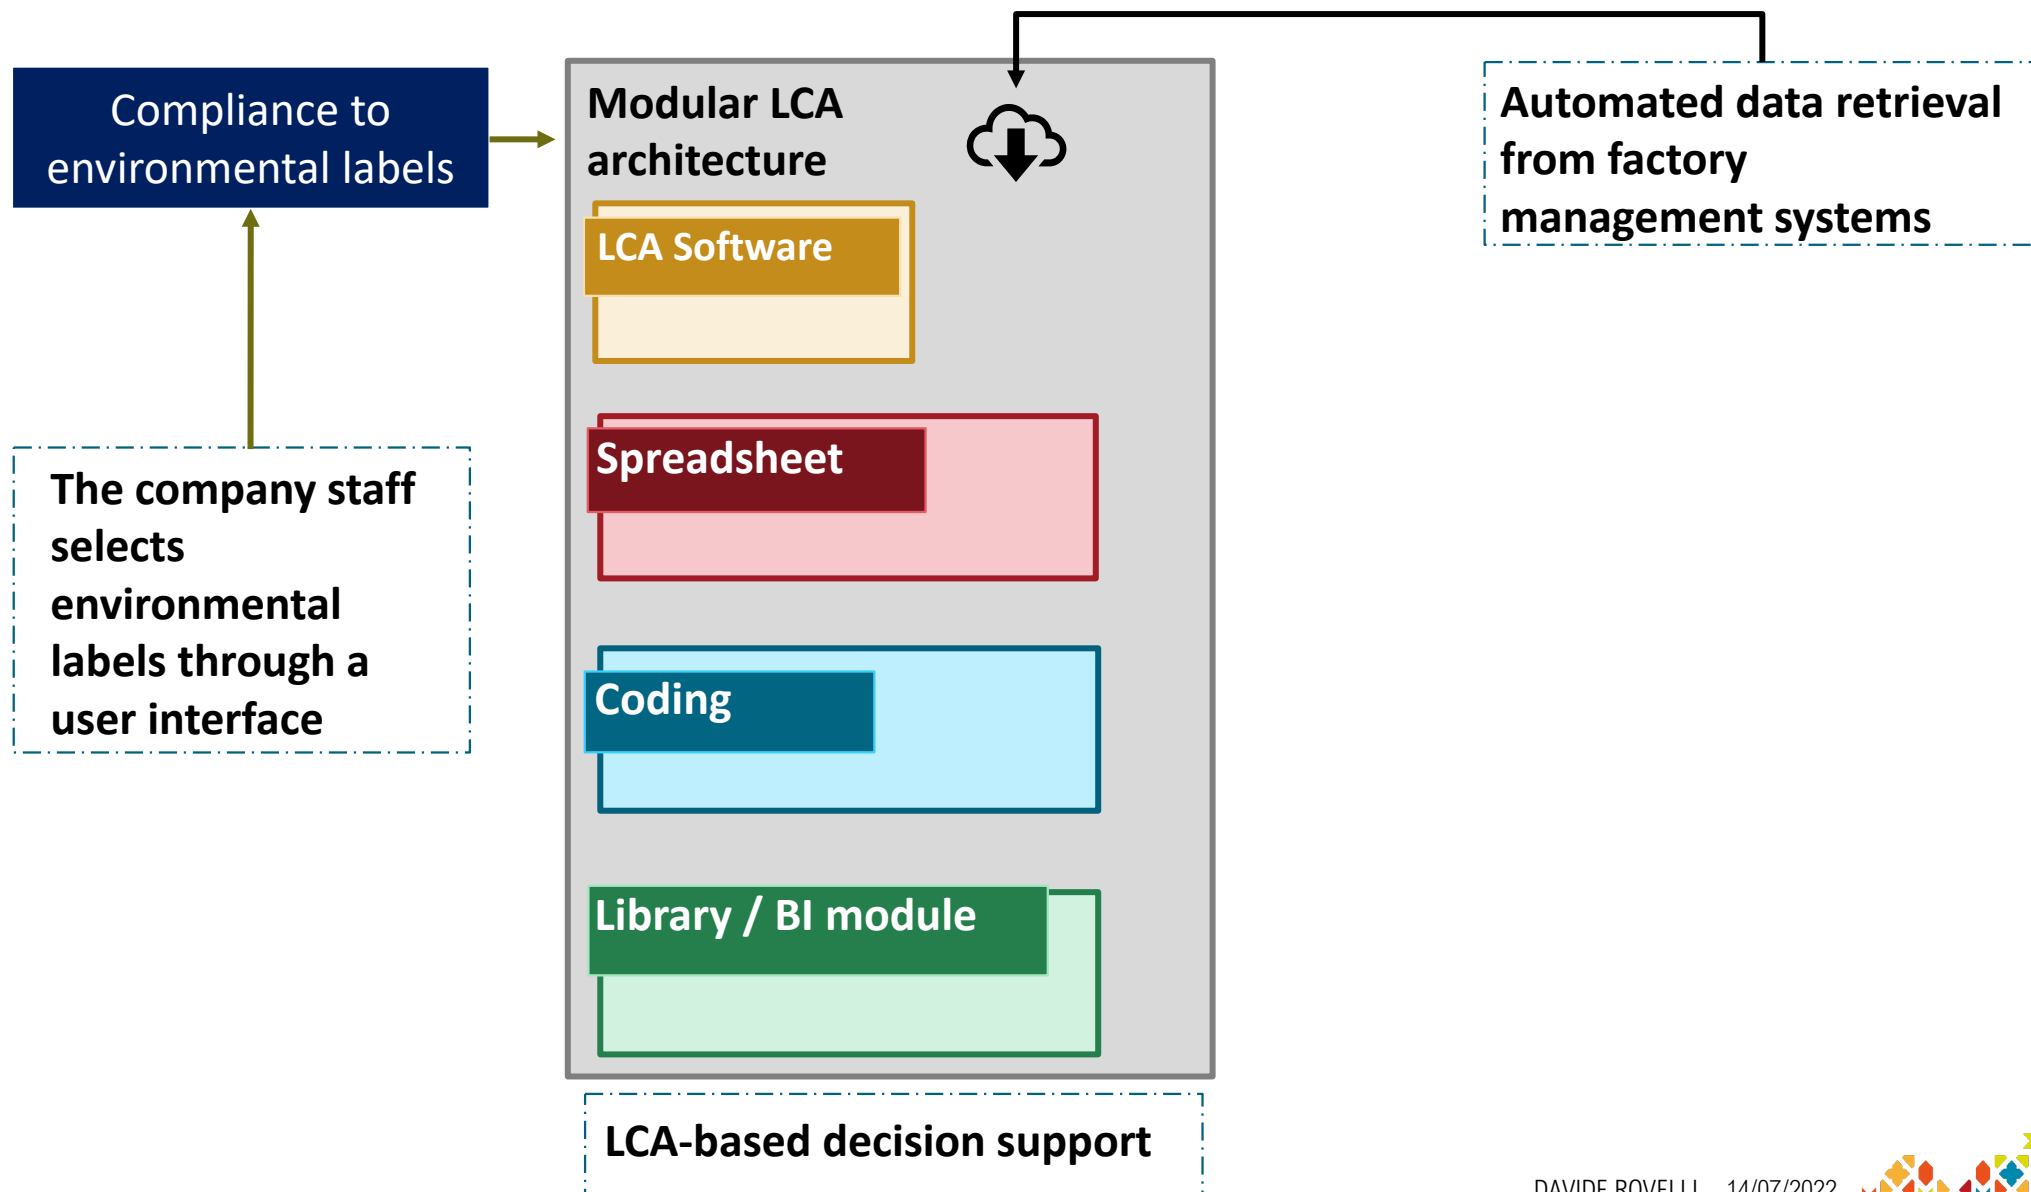

# FUTURE PERSPECTIVES

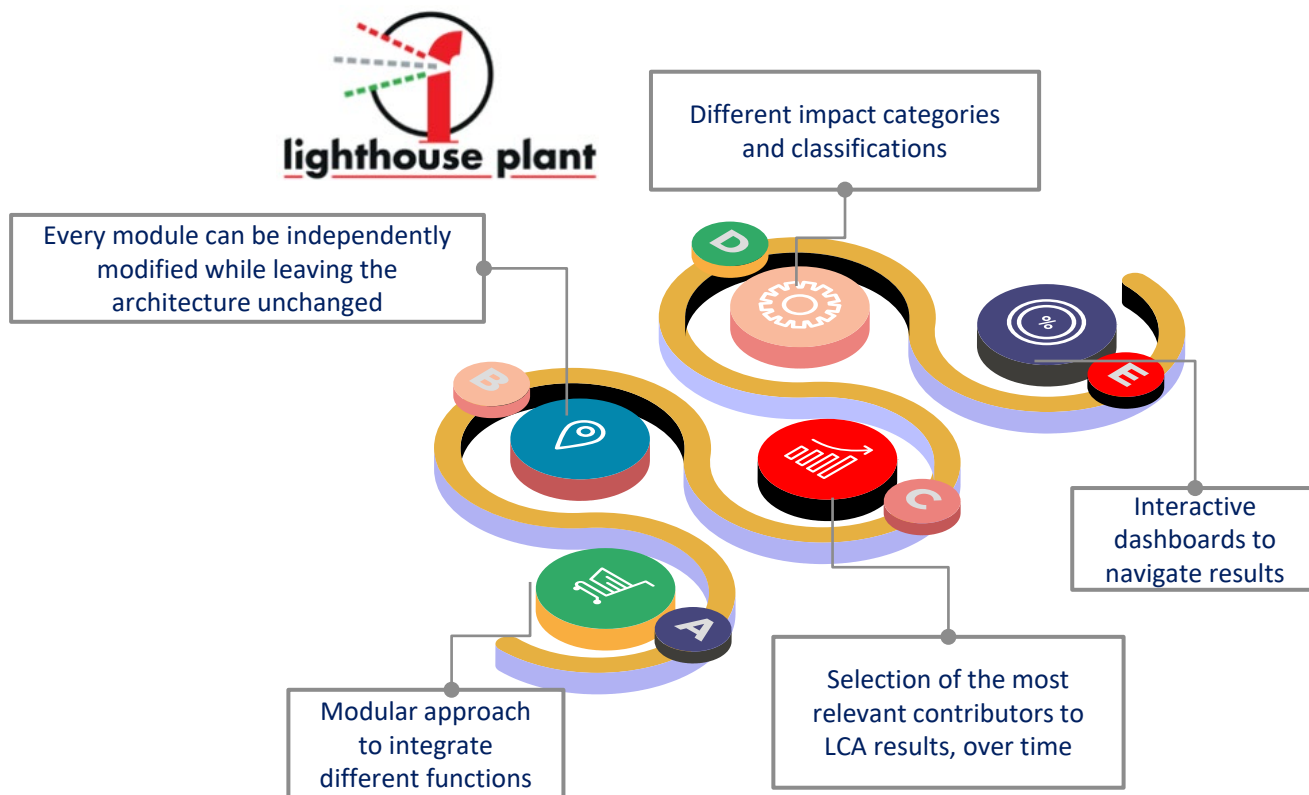

# FUTURE WORKS

## LIGHTHOUSE PROJECT

## E2COMATION PROJECT

# CRITICAL ASPECTS

## RESOLUTION

A significant variability was found, even if the results are still averaged over a month. Refining the temporal resolution to weekly/daily levels would disclose further variability. However, would it make sense to disclose it? Would the LCA-based decisions change?

## VISUALIZATION

We need to increase the effectiveness of our visualization module. Our interactive dashboards allow to navigate across thousands of values. However, such complexity may discourage a user from a company. How to convey complexity while keeping the visualizations relatively understandable?

## LCA-BASED SUPPORT SYSTEM

Inclusion of normalization and weighting steps across LCIA categories, refined simulations (with respect to simple what-if scenarios) and optimizations. How to contextualize the company performance within global trends and accordingly set targets of efficiency increases over time?
